

Study Jam 2.0 Quiz on L1 - L3

No	Question Text	Question Type	Option 1	Option 2	Option 3	Option 4	Option 5	Correct Answer	Explanation	Reference
1	Given the average coffee order, how much coffee can I expect to sell next week if I were to add a new brand of coffee? Answering this question comes under	Multiple Choice	Predictive analysis	Data analysis				1	Predictive analysis will help businesses predict future behavior based on existing data such as "Given the average coffee order, how much coffee can I expect to sell next week if I were to add a new brand of coffee?"	Lesson 1 - Topic 1
2	Mean, Median, Mode, Standard Deviation, and Interquartile range statistics are used in	Multiple Choice	Aggregation Analysis	Descriptive Analysis				2	-	Lesson 2 - Topic 3
3	Calculating the sales per month for each salesperson, and then adding the sales per month for all salespeople in each region is an example of	Multiple Choice	Aggregation Analysis	Descriptive Analysis				1	This methodology simply means calculating a value across a group or dimension and is commonly used in data analysis.	Lesson 2 - Topic 3
4	ShipYourStuff.com wants to know how much they ship to each zip code, state, or region as different managers want summaries by different dimensions. What type of data analysis methodology should be used?	Multiple Choice	Predictive	Geospatial	Aggregation	Descriptive	Segmentation	3	Question from the course. While this may seem like it is a Geospatial problem, it is actually an Aggregation problem. Why? Analysis of the location is not a critical part of the analysis, rather, the analysis involves summarizing data by location data that already exists.	Lesson 2 - Topic 3
5	The more variables that are included, the higher the r-squared value will be even if there is no relationship between the additional variables and the target variable.	Multiple Choice	TRUE	FALSE				1	In a nutshell, the more variables that are included, the higher the r-squared value will be - even if there is no relationship between the additional variables and the target variable.	Lesson 3 - Topic 13
6	To represent the categorical variable region with values west, midwest, northeast, and southeast, you'll need to add X dummy variables. Here, X is	Multiple Choice	3	4	2	5		1	You always create one less dummy variable than the number of categories to make sure that one category is represented by zero values for the dummy variables.	Lesson 3 - Topic 15
7	The range of r (correlation value) is from	Multiple Choice	-1 to +1	0 to 1	-1 to 0			1	The range of r is from -1 to +1.	Lesson 3 - Topic 8
8	In the business problem of predicting average number of tickets based on the number of employees, the variables are	Multiple Choice	predictor variable = no. of employees	dependent variable = no. of employees	predictor variable = avg. no. of tickets			1	The target variable is the variable we are trying to understand and predict. It is also referred to as the dependent variable. Predictor variables are used to try to predict the target variable and are also known as independent variables.	Lesson 3 - Topic 6
9	A high-end home goods manufacture wants to determine how much revenue they can expect if they send a catalog to the customers in their mailing list who are most likely to make a purchase if a catalog was sent to them. The model to be selected will be	Checkbox	Numeric	Classification	Continuous	Binary	Non-Binary	1,3	The outcome to predict is the amount of revenue, which is continuous, numeric variable. [They already know which customers in their mailing list are most likely to make a purchase if a catalog was sent to them.]	Lesson 2 - Topic 12
10	What kind of analytical technique(s) you should use for a business problem to predict outcome using a lot of data to perform non binary classification?	Checkbox	Forest Model	Boosted Model	Logistic Regression	ETS	A/B Testing	1,2	Analyst Methodology Map	Lesson 1 - Topic 1
